

Low Voltage Precision Adjustable Shunt Regulator

TLV431, NCV431, SCV431

The TLV431A, B and C series are precision low voltage shunt regulators that are programmable over a wide voltage range of 1.24 V to 16 V. The TLV431A series features a guaranteed reference accuracy of $\pm 1.0\%$ at 25 °C and $\pm 2.0\%$ over the entire industrial temperature range of -40 °C to 85 °C. The TLV431B series features higher reference accuracy of $\pm 0.5\%$ and $\pm 1.0\%$ respectively. For the TLV431C series, the accuracy is even higher. It is $\pm 0.2\%$ and $\pm 1.0\%$ respectively. These devices exhibit a sharp low current turn-on characteristic with a low dynamic impedance of 0.20 Ω over an operating current range of 100 μ A to 20 mA. This combination of features makes this series an excellent replacement for zener diodes in numerous applications circuits that require a precise reference voltage. When combined with an optocoupler, the TLV431A/B/C can be used as an error amplifier for controlling the feedback loop in isolated low output voltage (3.0 V to 3.3 V) switching power supplies. These devices are available in economical TO-92-3 and micro size TSOP-5 and SOT-23-3 packages.

1. Ambient temperature range: T_{low} = –40 °C, T_{high} = 85 °C.
2. Guaranteed but not tested.
3. The deviation parameters ΔV_{ref} and ΔI_{ref} are defined as the difference between the maximum value and minimum value obtained over the full operating ambient temperature range that applied.

The average temperature coefficient of the reference input voltage, αV_{ref} is defined as:

$$\alpha V_{ref} \left(\frac{ppm}{^{\circ}C} \right) = \frac{\left(\frac{\Delta V_{ref}}{V_{ref} (T_A = 25^{\circ}C)} \times 10^6 \right)}{\Delta T_A}$$

αV_{ref} can be positive or negative depending on whether V_{ref} Min or V_{ref} Max occurs at the lower ambient temperature, refer to Figure 8.

Example: ΔV_{ref} = 7.2 mV and the slope is positive,

$$V_{ref} @ 25^{\circ}C = 1.241 V$$

$$\Delta T_A = 125^{\circ}C$$

$$\alpha V_{ref} \left(\frac{ppm}{^{\circ}C} \right) = \frac{0.0072 \times 10^6}{1.241 \times 125} = 46 ppm/^{\circ}C$$

4. The dynamic impedance Z_{KA} is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operating with two external resistors, R1 and R2, (refer to Figure 4) the total dynamic impedance of the circuit is given by:

$$|Z_{KA}'| = |Z_{KA}| \times \left(1 + \frac{R1}{R2} \right)$$

STABILITY

Figures 18 and 19 show the stability boundaries and circuit configurations for the worst case conditions with the load capacitance mounted as close as possible to the device. The required load capacitance for stable operation can vary depending on the operating temperature and capacitor

equivalent series resistance (ESR). Ceramic or tantalum surface mount capacitors are recommended for both temperature and ESR. The application circuit stability should be verified over the anticipated operating current and temperature ranges.

The above circuit shows the TLV431A/B/C as a compensated amplifier controlling the feedback loop of an isolated output line powered switching regulator. The output voltage is programmed to 3.3 V by the resistors values selected for R1 and R2. The minimum output voltage that can be programmed with this circuit is 2.64 V, and is limited by the sum of the reference voltage (1.24 V) and the forward drop of the optocoupler light emitting diode (1.4 V). Capacitor C1 provides loop compensation.
